

## Liquidity Grab Reversal Playbook (Stage 1 - Manual A+ Setup)

### Core Setup Logic:

| Rule                | Condition                                                                                                         | Why it Matters                      |
|---------------------|-------------------------------------------------------------------------------------------------------------------|-------------------------------------|
| Context             | Price must sweep previous liquidity zone (AS High/Low, PWH, PDH, PDL)                                             | Traps liquidity and fuels reversal  |
| Location            | Reversal zones near key levels (Asia High/Low, VWAP, VWAP deviation)                                              | High probability reversal area      |
| Confirmation        | EMAs 9/21 crossover or divergence after sweep                                                                     | Shift in short-term momentum        |
| Entry               | Enter on 2M or 1M chart once candle closes under liquidity sweep high (for shorts) or above sweep low (for longs) | Keeps entry tight post manipulation |
| Stop Loss (SL)      | Above wick high (shorts) / below wick low (longs)                                                                 | Defined invalidation point          |
| Take Profit 1 (TP1) | VWAP or recent consolidation base                                                                                 | Realistic first target              |
| Take Profit 2 (TP2) | Liquidity zones (previous session mid/low/high)                                                                   | Full extension target               |

### Execution Examples:

- Short at 21928 -> exit at 21911
- Short at 22105 -> exit at 22096
- Short at 22106 -> exit at 22073

### Time Windows:

- Asia session sweeps (first 2-3 hours)
- NY open (most reactive zones)

### Stage 1 Pine Script: Liquidity Sweep Detector

```

//@version=5
indicator("Liquidity Sweep Detector (Stage 1)", overlay=true)

// Input Settings
ash = input.float(22110, "Asia Session High Level", group="Key Liquidity Levels")
pwh = input.float(22180, "Previous Week High", group="Key Liquidity Levels")
pdl = input.float(22050, "Previous Day Low", group="Key Liquidity Levels")
buffer = input.int(5, "Sweep Buffer (ticks)", group="Settings")

// Logic for sweeps
sweepHigh = high > ash + buffer or high > pwh + buffer
sweepLow = low < pdl - buffer

plotshape(sweepHigh, style=shape.triangledown, location=location.abovebar,
color=color.red, size=size.small, text="Sweep High")
plotshape(sweepLow, style=shape.triangleup, location=location.belowbar,
color=color.green, size=size.small, text="Sweep Low")

```

---

### Manual Process Summary:

- Let Pine Script highlight potential sweep zones.
- Wait for EMAs alignment + rejection wick formation.
- Enter on close of confirmation candle.
- Manage risk with small SL, take partials at VWAP, hold for full liquidity runs.

---

### Next Stage Preview:

- Stage 2 will add automatic EMAs, VWAP alignment, volume spike filters and build alerts for execution automation.
